beta beta beta biological honors society: How Far Have We Come in Reducing Health Disparities? Institute of Medicine, Board on Population Health and Public Health Practice, Roundtable on the Promotion of Health Equity and the Elimination of Health Disparities, 2012-09-12 At the turn of the 21st century, several important reports and events designed to raise awareness of health disparities and to describe initial efforts to reduce health disparities took place. The Surgeon General's office released several reports that showed dramatic disparities in tobacco use and access to mental health services by race and ethnicity. The first real legislation focused on reducing health disparities was signed into law, creating the National Center for Minority Health and Health Disparities within the NIH. In 2001, the IOM released its landmark report, Crossing the Quality Chasm: A New Health System for the 21st Century, highlighting the importance of a focus on health care quality rather than a focus on only access and cost issues. Building upon these reports and events, the IOM held a workshop on April 8, 2010, that discussed progress to address health disparities and focused on the success of various federal initiatives to reduce health disparities. How Far Have We Come in Reducing Health Disparities? summarizes the workshop and explains the progress in the field since 2000.

Townsend, 2014-03-19 Troy Townsend's thesis explores the structure, energetics and activity of three inorganic nanocrystal photocatalysts. The goal of this work is to investigate the potential of metal oxide nanocrystals for application in photocatalytic water splitting, which could one day provide us with clean hydrogen fuel derived from water and solar energy. Specifically, Townsend's work addresses the effects of co-catalyst addition to niobium oxide nanotubes for photocatalytic water reduction to hydrogen, and the first use of iron oxide 'rust' in nanocrystal suspensions for oxygen production. In addition, Townsend studies a nickel/oxide-strontium titanate nanocomposite which can be described as one of only four nanoscale water splitting photocatalysts. He also examines the charge transport for this system. Overall, this collection of studies brings relevance to the design of inorganic nanomaterials for photocatalytic water splitting while introducing new directions for solar energy conversion.
