medela pump in style advanced breast pump manual: *Lactivism* Courtney Jung, 2015-11-24 Social scientist and mother Courtney Jung explores the ever-expanding world of

breastfeeding advocacy, shining a new light on the diverse communities who compose it, the dubious science behind it, and the pernicious public policies to which it has given rise. Is breast really best? Breastfeeding is widely assumed to be the healthiest choice, yet growing evidence suggests that its benefits have been greatly exaggerated. New moms are pressured by doctors, health officials, and friends to avoid the bottle at all costs—often at the expense of their jobs, their pocketbooks, and their well-being. In *Lactivism*, political scientist Courtney Jung offers the most deeply researched and far-reaching critique of breastfeeding advocacy to date. Drawing on her own experience as a devoted mother who breastfed her two children and her expertise as a social scientist, Jung investigates the benefits of breastfeeding and asks why so many people across the political spectrum are passionately invested in promoting it, even as its health benefits have been persuasively challenged. What emerges is an eye-opening story about class and race in America, the big business of breastfeeding, and the fraught politics of contemporary motherhood.

medela pump in style advanced breast pump manual: *The Milk Memos* Cate Colburn-Smith, Andrea Serrette, 2007-03-15 This one-of-a-kind guide to balancing motherhood and work is based on actual journals kept by a group of IBM women during their visits to the company's employee lactation room. It all began when IBM manager Cate Colburn-Smith sat down in the company's employee lactation room, shed a few silent tears, and wrote the following on a paper towel: I'm a new mom and today is my first day back at work. Is anyone else using this room? Right away women responded, and the paper towel was eventually replaced by a series of notebooks, in which women offered one another advice and support on juggling work and a newborn. Based on the original notebooks, *The Milk Memos* is a heartwarming, encouraging (and often hilarious!) guide to working motherhood. It's one of the most existential moments any woman will face: sitting in a small room tucked away in the bowels of your company, pumping breast milk for a child so close to your heart—yet, at that moment, so far away. *The Milk Memos* records the voices of mothers who, while struggling with the difficulties of blending their two lives, prove that women don't have to choose between work and family. Their thoughts on how it can be done will inspire women everywhere. This invaluable book weaves the actual *Milk Memos* journal entries with information-packed sections on such topics of great concern to working moms as: - finding a private place to pump breast milk at work and establishing a routine that you can maintain despite your busy workday; - establishing the right daycare solution; - getting a decent night's sleep with a new baby so that you can shine (or at least glimmer!) during business hours; and - negotiating flextime, part-time, or a job share with an employer. The ultimate gift for any new mom who will soon return to work, *The Milk Memos* is destined to become a classic on the parenting shelf.

medela pump in style advanced breast pump manual: *Design and Development of a*

Manual Breast Pump Nur Atiqah Ramlan, 2010 This thesis deals with design and development of a manual breast pump with an ergonomic approach. This project is the further study of the previous project which is the preliminary design of the manual breast pump. The purpose of this study is to prevent the musculoskeletal disorder problems among mothers who expressed the breast milk using manual breast pump. The objectives of this study is to design a manual breast pump with ergonomics approach using Solidworks, to make a prototype of the designed manual breast pump using Rapid Prototyping machine and to validate the designed manual breast pump using simulation process and manual calculation. The scope of this project is that the developed manual breast pump is only a prototype and is not readily functional as a commercial product. While the validations of the manual breast pump through the simulation software is considered precise. The strategy of validation of finite element analysis was developed for this project. The finite element analysis was then performed using ALGOR and the bottle part of the design was analyzed using the static stress with linear material model. The other part of the design which is the pressure pump was also manually calculated. The obtained results indicate that the maximum value of the result shows in the bottom of the bottle due to the surface boundary condition. The manual calculation of the pressure pump shows that the design just can produce the maximum pressure of about 4,000 Pa. While a good manual breast pump should produce at least about 2,000 Pa. However the area is not suitable to be reducing in a great number due to the ergonomics condition.
